OA Prevalence & Burden
Osteoarthritis Prevention and Management in Primary Care
Arthritis is a serious health crisis. CDC estimates that 1 in 5 (or 53.2 million) US adults have some form of arthritis.\(^1\) While there are estimated to be more than 100 types of arthritis, OA is the most common form of arthritis, affecting 32.5 million US adults.\(^2\) The high prevalence of arthritis manifests in enormous societal and personal costs.

Data from: National Health Interview Survey 2013–2015

PREVALENCE BY AGE, GENDER, AND ETHNICITY

Age
• 43% of people with OA are 65 or older and 88% of people with OA are 45 or older.²
• Annual incidence of knee OA is highest between 55 and 64 years old.⁶
• More than half of individuals with symptomatic knee OA are younger than 65.⁶

Gender
• 62% of individuals with OA are women.²
• Among people younger than 45, OA is more common among men; above age 45, OA is more common in women.⁶

Ethnicity
• 78% of individuals with OA are non-Hispanic whites.²
• However, within their own race/ethnic groups, non-Hispanic black and Hispanic populations have higher rates of OA than non-Hispanic whites.²
• American Indians report among the highest prevalence of arthritis of any population in the US.¹⁰
• Documented musculoskeletal health disparities persist, with arthritis having a greater impact on people of color than Whites.¹²,¹³,¹⁸
• See Patient Burden/Activity & Work Limitations below for more details on racial disparities in OA.

PATIENT BURDEN

PAIN
• People with OA experience greater pain, fatigue, levels of disability, and activity limitations than people of their comparable age.⁴
• While arthritis pain is extremely individualized, severe joint pain is not uncommon. Recent estimates suggest that one-fourth of adults with arthritis experience severe joint pain, characterized by a score of 7 or greater on the 0–10 pain scale.⁵
• Severe joint pain occurs more often in middle-aged adults (45–64), women, non-Hispanic blacks, Hispanics, those with a disability, and in people with the following concurrent health conditions: fair/poor health, obesity, diabetes, heart disease, and serious psychological distress.⁵

DEPRESSION AND SOCIAL ISOLATION
• One-third of people with arthritis over the age of 45 suffer from depression or anxiety.¹⁸
• People with OA are likely at greater risk for depression because of increased disability and fatigue associated with their pain.⁷
• People with doctor-diagnosed arthritis report more days in the last month of poor mental health (5.4 days vs 2.8 days for people without arthritis).²
• Social isolation and loneliness are often evident among people with OA and other chronic musculoskeletal diseases. There appears to be a bi-directional relationship with pain impacting social isolation and loneliness, and vice versa.⁸

99% of all hip and knee replacements are done to address pain and functional limitations.¹⁸
Over 50% of people with knee OA will have a total knee replacement done during their lifetime.⁶
Pain—both chronic and episodic—can result in depression and other mood disturbances, functional disabilities, and work limitations.
ACTIVITY LIMITATIONS

- Almost 44% of people with arthritis have “arthritis-attributable activity limitations,” defined as self-reported limitations in “usual activities” because of arthritis symptoms.\(^1\)
- By 2040, 11.4% of all adults will experience arthritis-attributable activity limitations.\(^9\)
- Blacks with knee OA have greater prevalence, severity, progression, and worse pain and function compared with Whites.\(^14\)
- Over 60% of American Indians report AAALs and mobility restrictions.\(^15,17,18\)

WORK LIMITATIONS

- 30% of adults with arthritis find stooping, bending, or kneeling very difficult.
- 20% cannot or find it very difficult to walk 3 blocks or push/pull large objects.
- People with OA (working age) experience lower employment rates than those without OA. Research suggests that arthritis-related activity limitations might contribute to their lack of employment.
- Latinos are more likely to report greater pain, functional limitations, and work limitations than non-Latino Whites.\(^12,15,16\)

ECONOMIC BURDEN

The overall economic burden associated with OA in the US is estimated at $136.8 billion annually.\(^2\) This figure has more than doubled over the last decade. For perspective, the annual economic cost of arthritis surpasses that of tobacco-related health effects, cancer, and diabetes. Direct medical costs reach $65 billion annually.\(^2\)

- Because of OA, an estimated 1 million knee and hip replacements are completed each year.\(^18\)
- In 2013, OA was the 2nd most costly health condition treated in hospitals in the US.\(^10\)
- In 2013, total lost wages due to OA were $164 billion, or $4,040 less per adult with OA compared to those without OA.\(^10\)
- Increased absenteeism among workers with OA is fairly well documented, with workers with OA missing an average of 2 more days per year than workers without OA. Presenteeism, or loss of productivity while on the job, is less easy to calculate but is no less costly for workers or businesses.\(^11\)

Proportion of Adults Age 18 and Over with Self-Reported Doctor-Diagnosed Arthritis Reporting Limitations of Daily Living (ADL) and Activity Attributed to Arthritis, by Age, United States 2013–2015

THE BURDEN OF OSTEOARTHRITIS

Osteoarthritis: A Serious Disease

242 million people worldwide have symptomatic and activity-limiting OA of the hip and/or knee. OA pain affects sleep quality, mood, and participating in everyday life.

The Cost of Osteoarthritis

Absenteism costs $10.3 billion
Total costs $136 billion
Average direct cost $11,000 person/year

Indirect costs are $17 billion (i.e., lost earnings).
Direct costs are $65 billion (i.e., medical expenditures).
3rd most rapidly rising condition associated with disability, just behind diabetes and dementia.

OA significantly limits a person’s ability to self-manage other conditions, such as diabetes and hypertension.
A third of people with OA have 5 of more chronic conditions.
OA increases the risk of developing heart disease by 50%.

Reduced levels of physical activity, comorbid conditions, and adverse effects of medications lead to a 55% increase in all cause mortality.

ADDITIONAL READING

ACKNOWLEDGEMENTS AND DISCLOSURES

The Osteoarthritis Prevention & Management in Primary Care Toolkit was funded, in part, by a Pfizer Independent Grant for Learning and Change and by a cooperative agreement from the Centers for Disease Control and Prevention. Toolkit contents are solely the responsibility of the Osteoarthritis Action Alliance and acknowledged Stakeholders and are based on best evidence and best practices in medicine. The OAAA expresses appreciation to U.S. Bone & Joint Initiative for their partnership in developing the Toolkit and to the field of experts comprising the Stakeholder panel for their many contributions. A list of Stakeholders and contributors can be found on the OAAA website.
